Starting Treatment With UPTRAVI® (selexipag)

The TITRATION PHASE
The recommended starting dose of UPTRAVI is 200 mcg BID. To reach a patient’s highest tolerated dose, increase the dose in increments of 200 mcg BID, usually at weekly intervals (up to 1600 mcg BID).

DOSE ADJUSTMENTS IN PATIENTS WITH HEPATIC IMPAIRMENT
In patients with mild hepatic impairment (Child-Pugh class A), no dose adjustment is necessary. For patients with moderate hepatic impairment (Child-Pugh class B), the starting dose of UPTRAVI is 200 mcg BID. Increase in increments of 200 mcg BID daily at weekly intervals, as tolerated. Avoid use of UPTRAVI in patients with severe hepatic impairment (Child-Pugh class C).

CONSIDERATIONS WHEN TAKING UPTRAVI
UPTRAVI should be restarted at a lower dose and retitrated
MISSED DOSES
If a dose of medication is missed:
• Patients should take the missed dose as soon as possible, unless the next dose is within the next 6 hours
• If treatment is missed for 3 days or more
STARTING DOSE
BID 200 mcg

DOSE ACHIEVED IN THE PIVOTAL GRIPHON TRIAL
Patients on UPTRAVI achieved the following doses across the 3 prespecified groups:
• 23% (n=133) at 200-400 mcg BID
• 31% (n=179) at 600-1000 mcg BID
• 43% (n=246) at 1200-1600 mcg BID

IMPORTANT SAFETY INFORMATION
ADVERSE REACTIONS
Adverse reactions more frequent compared to placebo (≥3%) are headache (65% vs 32%), diarrhea (42% vs 18%), jaw pain (26% vs 6%), nausea (33% vs 18%), myalgia (16% vs 6%), vomiting (18% vs 9%), pain in extremity (17% vs 8%), flushing (12% vs 5%), arthralgia (11% vs 8%), anemia (8% vs 5%), decreased appetite (6% vs 3%), and rash (11% vs 8%).

CONTRAINdications
Concomitant use of strong inhibitors of CYP2C8 (eg, gemfibrozil) with UPTRAVI is contraindicated.

DRUG INTERACTIONS
CYP2C8 Inhibitors
Concomitant administration with an inducer of CYP2C8 and UGT 1A3 and 2B7 enzymes (rifampin) halved exposure to the active metabolite. Increase UPTRAVI dose, up to twice, when co-administered with rifampin. Reduce UPTRAVI when rifampin is stopped.

HYPERTHERMIA
Hypertension was observed in 1% (n=8) of patients on UPTRAVI and in none of the patients on placebo.

THE MAINTENANCE PHASE

Patients on UPTRAVI achieved the following doses across the 3 prespecified groups:

• 23% (n=133) at 200-400 mcg BID
• 31% (n=177) at 600-1000 mcg BID
• 47% (n=294) at 1200-1600 mcg BID

UPTRAVI® (selexipag) is indicated for the treatment of pulmonary arterial hypertension (PAH, WHO Group I).

1 Tablet Twice Daily With UPTRAVI® (selexipag)

UPTRAVI is available in the following strengths:

- 200 mcg Light yellow
- 400 mcg Red
- 600 mcg Light violet
- 800 mcg Green
- 1000 mcg Orange
- 1200 mcg Dark violet
- 1400 mcg Dark yellow
- 1600 mcg Brown

Tablet shown in box is representative of actual size.

DOSES ACHIEVED IN THE PIVOTAL GRIPHON TRIAL:

Patients on UPTRAVI achieved the following doses across the 3 prespecified groups:

• 31% (n=177) at 600-1000 mcg BID
• 43% (n=246) at 1200-1600 mcg BID

UPTRAVI is available in the following strengths:

- 200 mcg Light yellow
- 400 mcg Red
- 600 mcg Light violet
- 800 mcg Green
- 1000 mcg Orange
- 1200 mcg Dark violet
- 1400 mcg Dark yellow
- 1600 mcg Brown

Tablet shown in box is representative of actual size.

DOSE ADJUSTMENTS IN PATIENTS WITH HEPATIC IMPAIRMENT

For patients with moderate hepatic impairment (Child-Pugh class B), the starting dose of UPTRAVI is 200 mcg BID. To reach a patient's highest tolerated dose, increase the dose in increments of 200 mcg BID, usually at weekly intervals (up to 1600 mcg BID).

The recommended starting dose of UPTRAVI is 200 mcg BID. To reach a patient's highest tolerated dose, increase the dose in increments of 200 mcg BID, usually at weekly intervals (up to 1600 mcg BID).

CONSIDERATIONS WHEN TAKING UPTRAVI

- UPTRAVI should be restarted at a lower dose and retitrated, if dose cannot be tolerated, decrease UPTRAVI BID to the patient's current dose. Usually at weekly intervals by adding increments of 200 mcg BID. If dose cannot be tolerated, decrease DOWN-TITRATE 200 mcg BID to the patient's current dose.
- The dose by 200 mcg BID.
- If a dose of medication is missed UPTRAVI is taken with food.
- Tolerability may be improved when 800 mcg tablet (used to reduce the number of tablets needed per dose)
- Tablets shown in box are representative of actual size.

THE TITRATION PHASE

Starting Treatment With UPTRAVI:

• If treatment is missed for 3 days or more
• If a dose of medication is missed

Patients should take the missed dose as soon as possible, unless the next dose is within the next 6 hours.

DOSE ADJUSTMENTS IN PATIENTS WITH HEPATIC IMPAIRMENT

For patients with moderate hepatic impairment (Child-Pugh class B), the starting dose of UPTRAVI is 200 mcg BID. To reach a patient's highest tolerated dose, increase the dose in increments of 200 mcg BID, usually at weekly intervals (up to 1600 mcg BID).

The recommended starting dose of UPTRAVI is 200 mcg BID. To reach a patient's highest tolerated dose, increase the dose in increments of 200 mcg BID, usually at weekly intervals (up to 1600 mcg BID).

CONSIDERATIONS WHEN TAKING UPTRAVI

- UPTRAVI should be restarted at a lower dose and retitrated, if dose cannot be tolerated, decrease UPTRAVI BID to the patient's current dose. Usually at weekly intervals by adding increments of 200 mcg BID. If dose cannot be tolerated, decrease DOWN-TITRATE 200 mcg BID to the patient's current dose.
- The dose by 200 mcg BID.
- If a dose of medication is missed UPTRAVI is taken with food.
- Tolerability may be improved when 800 mcg tablet (used to reduce the number of tablets needed per dose)
- Tablets shown in box are representative of actual size.

THE TITRATION PHASE

Starting Treatment With UPTRAVI:

• If treatment is missed for 3 days or more
• If a dose of medication is missed

Patients should take the missed dose as soon as possible, unless the next dose is within the next 6 hours.

DOSE ADJUSTMENTS IN PATIENTS WITH HEPATIC IMPAIRMENT

For patients with moderate hepatic impairment (Child-Pugh class B), the starting dose of UPTRAVI is 200 mcg BID. To reach a patient's highest tolerated dose, increase the dose in increments of 200 mcg BID, usually at weekly intervals (up to 1600 mcg BID).

The recommended starting dose of UPTRAVI is 200 mcg BID. To reach a patient's highest tolerated dose, increase the dose in increments of 200 mcg BID, usually at weekly intervals (up to 1600 mcg BID).

CONSIDERATIONS WHEN TAKING UPTRAVI

- UPTRAVI should be restarted at a lower dose and retitrated, if dose cannot be tolerated, decrease UPTRAVI BID to the patient's current dose. Usually at weekly intervals by adding increments of 200 mcg BID. If dose cannot be tolerated, decrease DOWN-TITRATE 200 mcg BID to the patient's current dose.
- The dose by 200 mcg BID.
- If a dose of medication is missed UPTRAVI is taken with food.
- Tolerability may be improved when 800 mcg tablet (used to reduce the number of tablets needed per dose)
- Tablets shown in box are representative of actual size.

THE TITRATION PHASE

Starting Treatment With UPTRAVI:

• If treatment is missed for 3 days or more
• If a dose of medication is missed

Patients should take the missed dose as soon as possible, unless the next dose is within the next 6 hours.

DOSE ADJUSTMENTS IN PATIENTS WITH HEPATIC IMPAIRMENT

For patients with moderate hepatic impairment (Child-Pugh class B), the starting dose of UPTRAVI is 200 mcg BID. To reach a patient's highest tolerated dose, increase the dose in increments of 200 mcg BID, usually at weekly intervals (up to 1600 mcg BID).

The recommended starting dose of UPTRAVI is 200 mcg BID. To reach a patient's highest tolerated dose, increase the dose in increments of 200 mcg BID, usually at weekly intervals (up to 1600 mcg BID).

CONSIDERATIONS WHEN TAKING UPTRAVI

- UPTRAVI should be restarted at a lower dose and retitrated, if dose cannot be tolerated, decrease UPTRAVI BID to the patient's current dose. Usually at weekly intervals by adding increments of 200 mcg BID. If dose cannot be tolerated, decrease DOWN-TITRATE 200 mcg BID to the patient's current dose.
- The dose by 200 mcg BID.
- If a dose of medication is missed UPTRAVI is taken with food.
- Tolerability may be improved when 800 mcg tablet (used to reduce the number of tablets needed per dose)
- Tablets shown in box are representative of actual size.
UPTRAVI® (selexipag) tablets, for oral use
Initial U.S. Approval: 2015

RECENT MAJOR CHANGES
07/2017

INDICATIONS AND USAGE
UPTRAVI® is a prostacyclin receptor agonist indicated for the treatment of pulmonary arterial hypertension (PAH, WHO Group I) to delay disease progression and reduce the risk of hospitalization for PAH. (1.1)

DOSAGE AND ADMINISTRATION
• Starting dose: 200 mcg twice daily. (2.1)
• Increase the dose by 200 mcg twice daily at weekly intervals to the highest tolerated dose up to 1600 mcg twice daily. (2.1)
• Maintenance dose is determined by tolerability. (2.1)
• Moderate hepatic impairment: Starting dose 200 mcg once daily, increase the dose by 200 mcg once daily at weekly intervals to the highest tolerated dose up to 1600 mcg. (2.2)

Contraindications
Severe hepatic impairment: Avoid use. (8.6)

WARNINGS AND PRECAUTIONS
Pulmonary edema in patients with pulmonary veno-occlusive disease. If confirmed, discontinue treatment. (5.1)

ADVERSE REACTIONS
Adverse reactions occurring more frequently (≥5%) on UPTRAVI compared to placebo are headache, diarrhea, jaw pain, nausea, myalgia, vomiting, pain in extremity, and flushing. (6.1)

See 17 for PATIENT COUNSELING INFORMATION and FDA-approved patient labeling. Revised: 07/2017
6 ADVERSE REACTIONS

6.1 Clinical Trial Experience

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.

The safety of UPTRAVI has been evaluated in a long-term, placebo-controlled study enrolling 1158 patients with symptomatic PAH (GROUPN study) [see Clinical Studies (14)]. The exposure to UPTRAVI in this trial was up to 4.2 years with median duration of exposure of 1.4 years. Table 1 presents adverse reactions more frequent on UPTRAVI than on placebo by ≥3%.

### Table 1  Adverse Reactions

</tbody>
</table>

These adverse reactions are more frequent during the dose titration phase.

Hyperthyroidism was observed in 1% (n=8) of patients on UPTRAVI and in none of the patients on placebo.

### Laboratory Test Abnormalities

#### Hemoglobin

In a Phase 3 placebo-controlled study in patients with PAH, mean absolute changes in hemoglobin at regular visits compared to baseline ranged from −0.34 to −0.02 g/dL in the selexipag group compared to −0.05 to 0.25 g/dL in the placebo group. A decrease in hemoglobin concentration to below 10 g/dL was reported in 8.6% of patients treated with selexipag and 5.0% of placebo-treated patients.

#### Thyroid function tests

In a Phase 3 placebo-controlled study in patients with PAH, a reduction (up to −0.3 MU/L from a baseline median of 2.5 MU/L) in median thyroid-stimulating hormone (TSH) was observed at most visits in the selexipag group. In the placebo group, little change in median values was apparent. There were no mean changes in triiodothyronine or thyroxine in either group.

7 DRUG INTERACTIONS

7.1 CYP2C8 Inhibitors

Concomitant administration with gemfibrozil, a strong inhibitor of CYP2C8, doubled exposure to selexipag and increased exposure to the active metabolite by approximately 10-fold. Concomitant administration of UPTRAVI with strong inhibitors of CYP2C8 (e.g., gemfibrozil) is contraindicated [see Clinical Pharmacology (12.3)].

Although not studied, use of UPTRAVI with moderate CYP2C8 inhibitors (e.g., telafenacime and deferasirox) can be expected to increase exposure to the active metabolite of selexipag. Consider a less frequent dosing regimen, e.g., once-daily, when initiating UPTRAVI in patients on a moderate CYP2C8 inhibitor. Reduce UPTRAVI when a moderate CYP2C8 inhibitor is initiated.

7.2 CYP2C8 Inducers

Concomitant administration with an inducer of CYP2C8 and UGT 1A3 and 2B7 enzymes (rifampin) halved exposure to the active metabolite. Increase dose up to twice of UPTRAVI when co-administered with rifampin. Reduce UPTRAVI when rifampin is stopped [see Clinical Pharmacology (12.3)].

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

#### Risk Summary

There are no adequate and well-controlled studies with UPTRAVI in pregnant women. Animal reproduction studies performed with selexipag showed no clinically relevant effects on embryofetal development and survival. A slight reduction in maternal as well as in fetal body weight was observed in parallel with a slight reduction in maternal body weight at the high dose. Pregnant rabbits were treated with selexipag using oral doses of 3, 10, and 30 mg/kg (up to 50 times the exposure to the active metabolite at the maximum recommended human dose of 1600 mcg twice daily on an AUC basis) during the period of organogenesis (gestation days 7 to 17). Selexipag did not cause adverse developmental effects to the fetus in this study.

The estimated background risk of major birth defects and miscarriage for the indicated population is unknown. In the U.S. general population, the estimated background risk of major birth defects and miscarriage in clinically recognized pregnancies is 2-4% and 15-20%, respectively.

8.2 Lactation

It is not known if UPTRAVI is present in human milk. Selexipag or its metabolites were present in the milk of rats. Because many drugs are present in the human milk and because of the potential for serious adverse reactions in nursing infants, discontinue nursing or discontinue UPTRAVI.

8.4 Pediatric Use

Safety and effectiveness in pediatric patients have not been established.

8.5 Geriatric Use

Of the 1368 subjects in clinical studies of UPTRAVI 248 subjects were 65 years of age and older, while 19 were 75 and older. No overall differences were observed between these subjects and younger subjects, and other reported clinical experience has not identified differences in responses between the elderly and younger patients, but greater sensitivity cannot be ruled out.

8.6 Patients with Hepatic Impairment

No adjustment to the dosing regimen is needed in patients with mild hepatic impairment (Child-Pugh class A).

A once-daily regimen is recommended in patients with moderate hepatic impairment (Child-Pugh class B) due to the increased exposure to selexipag and its active metabolite. There is no experience with UPTRAVI in patients with severe hepatic impairment (Child-Pugh class C). Avoid use of UPTRAVI in patients with severe hepatic impairment [see Dosage and Administration (2.3) and Clinical Pharmacology (12.3)].

8.7 Patients with Renal Impairment

No adjustment to the dosing regimen is needed in patients with estimated glomerular filtration rate > 15 mL/min/1.73 m².

There is no clinical experience with UPTRAVI in patients undergoing dialysis or in patients with glomerular filtration rates < 15 mL/min/1.73 m² [see Clinical Pharmacology (12.3)].

10 OVERDOSAGE

Isolated cases of overdose up to 3200 mcg were reported. Mild, transient nausea was the only reported consequence. In the event of overdose, supportive measures must be taken as required. Dialysis is unlikely to be effective because selexipag and its active metabolite are highly protein-bound.

11 DESCRIPTION

UPTRAVI (selexipag) is a selective non-prostanoid IP prostacyclin receptor agonist. The chemical name of selexipag is 2-{4-[(5,6-diphenylpyrazin-2-yl)(isopropyl)amino]butoxy}-(methylsulfonyl)-N-methylsulfonil) acetamide. It has a molecular formula of C₂₀H₁₅N₂O₄S and a molecular weight of 496.62. Selexipag has the following structural formula:

![Selexipag Structure](image-url)

Selexipag is a pale yellow crystalline powder that is practically insoluble in water. In the solid state selexipag is very stable, is not hygroscopic, and is not light sensitive.

Depending on the dose strength, each round film-coated tablet for oral administration contains 200, 400, 600, 800, 1000, 1200, 1400, or 1600 mcg of selexipag. The tablets include the following inactive ingredients: D-mannitol, corn starch, low substituted hydroxypropyl cellulose, hydroxypropylcellulose, and magnesium stearate. The tablets are film-coated with a coating material containing hypromellose, propylene glycol, titanium dioxide, carnauba wax along with mixtures of iron oxide red, iron oxide yellow or iron oxide black.

11 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

Selexipag is an oral prostacyclin receptor (IP receptor) agonist that is structurally distinct from prostacyclin. Selexipag is hydrolyzed by carboxylesterase 1 to yield its active metabolite, which is approximately 37-fold as potent as selexipag. Selexipag and the active metabolite are selective for the IP receptor versus other prostanoid receptors (EP₁, EP₂, DP, FP, and TP).

12.2 Pharmacodynamics

Cardiac electrophysiology:

At the maximum tolerated dose of 1600 mcg twice daily, selexipag does not prolong the QT interval to any clinically relevant extent.
Platelet aggregation: Both selexipag and its active metabolite caused concentration-dependent inhibition of platelet aggregation in vitro with an IC_{50} of 5.5 µM and 0.21 µM, respectively. However, at clinically relevant concentrations, there was no effect on platelet aggregation test parameters as seen following multiple-dose administrations of selexipag in healthy subjects from 400 mcg up to 1800 mcg twice daily.

Pulmonary hemodynamics: A Phase 2 clinical study assessed hemodynamic variables after 17 weeks of treatment in patients with PAH WHO Functional Class II–III and concomitantly receiving endothelin receptor antagonists (ERAs) and/or phosphodiesterase type 5 (PDE-5) inhibitors. Patients titrating selexipag to an individually tolerated dose (200 mcg twice daily increments up to 800 mcg twice daily) (N=33) achieved a statistically-significant mean reduction in pulmonary vascular resistance of 30.3% (95% confidence interval [CI] 4.4%–47.2%) and an increase in cardiac index (median treatment effect) of 0.41 L/min/m² (95% CI 0.10, 0.71) compared to placebo (N=10).

Drug interactions: In a study in healthy subjects, selexipag (400 mcg twice a day) did not influence the pharmacodynamic effect of warfarin on the international normalized ratio.

12.3 Pharmacokinetics

The pharmacokinetics of selexipag and its active metabolite have been studied primarily in healthy subjects. The pharmacokinetics of selexipag and the active metabolite, after both single- and multiple-dose administration, were dose-proportional up to a single dose of 800 mcg and multiple doses of up to 1800 mcg twice daily.

In healthy subjects, inter-subject variability in exposure (area under the curve over a dosing interval, AUC) at steady-state was 43% and 39% for selexipag and the active metabolite, respectively. Intrasubject variability in exposure was 24% and 19% for selexipag and the active metabolite, respectively.

Exposures to selexipag and the active metabolite at steady-state in PAH patients and healthy subjects were similar. The pharmacokinetics of selexipag and the active metabolite in PAH patients were not influenced by the severity of the disease and did not change with time. Both in healthy subjects and PAH patients, after oral administration, exposure at steady-state to the active metabolite is approximately 3- to 4-fold that of selexipag. Exposure to the active metabolite is approximately 30% higher after oral administration compared to the same intravenous dose in healthy subjects.

Absorption

The absolute bioavailability of selexipag is approximately 49%. Upon oral administration, maximum observed plasma concentrations of selexipag and its active metabolite are reached within about 1–3 hours and 3–4 hours, respectively.

In the presence of food, the absorption of selexipag was prolonged resulting in a delayed time to peak concentration (C_{max}) and ~30% lower peak plasma concentration (C_{max}). The exposure to selexipag and the active metabolite (AUC) did not significantly change in the presence of food.

Distribution

The volume of distribution of selexipag at steady state is 11.7 L. Selexipag and its active metabolite are highly bound to plasma proteins (approximately 99% in total and to the same extent to albumin and alpha-1-acid glycoprotein).

Metabolism

Selexipag is hydrolyzed to its active metabolite, (free carboxylic acid) in the liver and intestine by carboxylesterases. Oxidative metabolism, catalyzed mainly by CYP3A4 and to a smaller extent by CYP2E1, leads to the formation of dealkylated products. UGT1A3 and UGT2B7 are involved in the glucuronidation of the active metabolite. Except for the active metabolite, none of the circulating metabolites in human plasma exceeds 3% of the total drug-related material.

Elimination

Elimination of selexipag is predominately via metabolism with a mean terminal half-life of 0.8-2.5 hours. The terminal half-life of the active metabolite is 6.2±13.5 hours. There is minimal accumulation of the active metabolite upon twice daily repeat administration suggesting that the effective half-life is in the range of 3-4 hours. The total body clearance of selexipag is 17.9 L/hour.

Excretion

In a study in healthy subjects with radiolabeled selexipag, approximately 93% of radioactive drug material was eliminated in feces and only 12% in urine. Neither selexipag nor its active metabolite were found in urine.

Specific Populations:

No clinically relevant effects of sex, race, age or body weight on the pharmacokinetics of selexipag and its active metabolite have been observed in healthy subjects or PAH patients.

Age

The pharmacokinetic variables (C_{max} and AUC) were similar in adult and elderly subjects up to 75 years of age. There was no effect of age on the pharmacokinetics of selexipag and the active metabolite in PAH patients.

Hepatic Impairment

In subjects with mild (Child-Pugh class A) or moderate (Child-Pugh class B) hepatic impairment, exposure to selexipag was 2- and 4-fold that seen in healthy subjects. Exposure to the active metabolite of selexipag remained almost unchanged in subjects with mild hepatic impairment and was doubled in subjects with moderate hepatic impairment [see Use in Specific Populations (8.6)].

Based on pharmacokinetic modeling of data from a study in subjects with hepatic impairment, the exposure to the active metabolite at steady state in subjects with moderate hepatic impairment (Child-Pugh class B) after a once daily regimen is expected to be similar to that in healthy subjects receiving a twice-daily regimen. The exposure to selexipag at steady state in these patients during a once daily regimen is predicted to be approximately 2-fold that seen in healthy subjects receiving a twice-daily regimen.

Renal Impairment

A 40-70% increase in exposure (maximum plasma concentration and area under the plasma concentration-time curve) to selexipag and its active metabolite was observed in subjects with severe renal impairment (estimated glomerular filtration rate (eGFR) < 30 mL/min/1.73 m²) [see Use in Specific Populations (8.9)].

Drug Interaction Studies:

Selexipag is hydrolyzed to its active metabolite by carboxylesterases. Selexipag and its active metabolite both undergo oxidative metabolism mainly by CYP2C8 and to a smaller extent by CYP3A4. The glucuronidation of the active metabolite is catalyzed by UGT1A3 and UGT2B7. Selexipag and its active metabolite are substrates of OATP1B1 and OATP1B3. Selexipag is a substrate of P-gp, and the active metabolite is a substrate of the transporter of breast cancer resistance protein (BCRP).

Selexipag and its active metabolite do not inhibit or induce hepatic cytochrome P450 enzymes at clinically relevant concentrations. Selexipag and its active metabolite do not inhibit hepatic or renal transport proteins.

The effect of moderate inhibitors of CYP2C8 on the exposure to selexipag or its active metabolite has not been studied. Concomitant administration with moderate inhibitors of CYP2C8 may result in a significant increase in exposure to selexipag and its active metabolite [see Drug Interactions (7.9)].

The results on in vivo drug interaction studies are presented in Figure 1.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

Carcinogenesis: In the 2-year carcinogenicity studies, chronic oral administration of selexipag revealed no evidence of carcinogenic potential in rats at 100 mg/kg/day and mice at 500 mg/kg/day. The exposures were more than 25-fold human exposure.

Mutagenesis: Selexipag and the active metabolite are not genotoxic on the basis of the overall evidence of conducted genotoxicity studies.

Fertility: The no effect dose for effects on fertility was 60 mg/kg/day in a study in which rats were administered selexipag orally. This dose corresponded to an exposure of 175-times (active metabolite) the human therapeutic exposure.

14 CLINICAL STUDIES

14.1 Pulmonary Arterial Hypertension

The effect of selexipag on progression of PAH was demonstrated in a multi-center, double-blind, placebo-controlled, parallel group, event-driven study (GRIPHON) in 1156 patients with symptoms WHO Functional Class II and III at baseline.

In the primary study endpoint was the time to first occurrence up to end-of-treatment of a) death, b) hospitalization for PAH, c) PAH worsening resulting in need for lung transplantation, or balloon atrial septostomy, d) initiation of parenteral prostanoid therapy or chronic oxygen therapy, or e) other disease progression based on a 15% decrease from baseline in 6MWD plus worsening of Functional Class or need for additional PAH-specific therapy.

The mean age was 48 years, the majority of patients were white (65%) and female (80%). Nearly all patients were in WHO Functional Class II and III at baseline.

Idiopathic or heritable PAH was the most common etiology in the study population (58%) followed by PAH associated with connective tissue disease (29%), PAH associated with congenital heart disease with repaired shunts (10%), drugs and toxins (2%), and HIV (1%). At baseline, the majority of enrolled patients (80%) were being treated with a stable dose of an endothelin receptor antagonist (15%), a PDE-5 inhibitor (32%), or both (33%).

Patients on selexipag achieved doses within the following groups: 200-400 mcg (23%), 600-1000 mcg (31%) and 1200-1600 mcg (43%).

Treatment with UPTRAVI resulted in a 40% reduction (99% CI: 22 to 54%; two-sided log-rank p-value < 0.0001) of the occurrence of primary endpoint events compared to placebo (Table 2; Figure 2). The beneficial effect of UPTRAVI was primarily attributable to a reduction in hospitalization for PAH and a reduction in other disease progression events (Table 2). The observed benefit of UPTRAVI was similar regardless of the dose achieved when patients were titrated to their highest tolerated dose [see Dosage and Administration (2.1)].

</table>

As first event:
- Hospitalization for PAH
- Other disease progression (Decrease in 6MWD plus worsening functional class or need for other therapy)
- Death
- Parenteral prostanoid or chronic oxygen therapy
- PAH worsening resulting in need for lung transplantation or balloon atrial septostomy

It is not known if the excess number of deaths in the selexipag group is drug-related because there were so few deaths and the imbalance was not observed until 18 months into GRIPHON.

Figures 3A, B, and C show time to first event analyses for primary endpoint components of hospitalization for PAH (A), other disease progression (B), and death (C)—all censored 7 days after any primary end point event (because many patients on placebo transitioned to open-label UPTRAVI at this point).

The treatment effect of UPTRAVI on time to first primary event was consistent irrespective of background PAH therapy (i.e., in combination with an ERA, PDE-5i, both, or without background therapy) (Figure 4).

</tbody>
</table>

Note: Race group “Other” is not displayed in analysis, as the population is less than 30. EU = Number of UPTRAVI patients with events, NU = Number of patients randomized to UPTRAVI, EP = Number of Placebo patients with events, NP = Number of patients randomized to Placebo, HR = Hazard Ratio, CI = Confidence Interval, the size of the squares represent the number of patients in the subgroup.

Note: The figure above presents effects in various subgroups all of which are baseline characteristics and all were pre-specified. The 99% confidence limits that are shown do not take into account how many comparisons were made, nor do they reflect the effect of a particular factor after adjustment for all other factors. Apparent homogeneity or heterogeneity among groups should not be over-interpreted.

6-Minute Walk Distance (6MWD)

Exercise capacity was evaluated as a secondary endpoint. Median absolute change from baseline to week 26 in 6MWD measured at trough (i.e., at approximately 12 hours post-dose) was +4 meters with UPTRAVI and -9 meters in the placebo group. This resulted in a placebo-corrected median treatment effect of 12 meters (99% CI: 1, 24 meters; two-sided p = 0.005).

16 HOW SUPPLIED/STORAGE AND HANDLING

UPTRAVI (selexipag) film-coated, round tablets are supplied in the following configurations:

<table>
<thead>
<tr>
<th>Strength (mcg)</th>

</tr>
</tbody>
</table>

UPTRAVI is also supplied in a Titration Pack [NDC 66215-628-20] that includes a 140 count bottle of 200 mcg tablets and a 60 count bottle of 800 mcg tablets.

Store at 20°C to 25°C (68°F to 77°F). Excursions are permitted between 15°C and 30°C (59°F and 86°F) [see USP Controlled Room Temperature].

17 PATIENT COUNSELING INFORMATION

Advise the patient to read the FDA-approved patient labeling (Patient Package Insert).

Inform patients:

- what to do if they miss a dose
- not to split, crush, or chew tablets.

Patient Information
UPTRAVI (up-TRA-vee)
(selexipag) tablets

Read this Patient Information before you start taking UPTRAVI and each time you get a refill. There may be new information. This information does not take the place of talking to your healthcare provider about your medical condition or your treatment.

What is UPTRAVI?
• UPTRAVI is a prescription medicine used to treat pulmonary arterial hypertension (PAH) which is high blood pressure in the arteries of your lungs.
• UPTRAVI can help slow down the progression of your disease and lower your risk of being hospitalized for PAH.

It is not known if UPTRAVI is safe and effective in children.

Who should not take UPTRAVI?
Do not take UPTRAVI if you
Take gemfibrozil because this medicine may affect how UPTRAVI works and cause side effects.

What should I tell my healthcare provider before taking UPTRAVI?
Before you take UPTRAVI, tell your healthcare provider if you:
• have liver problems.
• have narrowing of the pulmonary veins, a condition called pulmonary veno-occlusive disease.
• are pregnant or plan to become pregnant. It is not known if UPTRAVI will harm your unborn baby.
• are breastfeeding or plan to breastfeed. It is not known if UPTRAVI passes into your breast milk. You and your healthcare provider should decide if you will take UPTRAVI or breastfeed. You should not do both.
• have any other medical conditions

Tell your healthcare provider about all the medicines you take, including prescription and over-the-counter medicines, vitamins, and herbal supplements. UPTRAVI and other medicines may affect each other causing side effects. Do not start any new medicine until you check with your healthcare provider.

How should I take UPTRAVI?
• Take UPTRAVI exactly as your healthcare provider tells you to take it. Do not stop taking UPTRAVI unless your healthcare provider tells you to stop.
• Your healthcare provider will slowly increase your dose to find the dose of UPTRAVI that is right for you.
• If you have side effects, your healthcare provider may tell you to change your dose of UPTRAVI.
• UPTRAVI can be taken with or without food. Taking UPTRAVI with food may help you tolerate UPTRAVI better.
• UPTRAVI is usually taken 2 times each day.
• Swallow UPTRAVI tablets whole. Do not split, crush or chew UPTRAVI tablets.
• If you miss a dose of UPTRAVI, take it as soon as you remember. If your next scheduled dose is due within 6 hours, skip the missed dose. Take the next dose at your regular time.
• If you miss 3 or more days of UPTRAVI, call your healthcare provider to see if your dose needs to be changed.
• If you take too much UPTRAVI, call your healthcare provider or go to the nearest hospital emergency room right away.

What are the possible side effects of UPTRAVI?
The most common side effects of UPTRAVI include:
• Headache
• jaw pain
• muscle pain
• pain in arms or legs
• pain in joints
• decreased appetite
• diarrhea
• nausea
• vomiting
• flushing
• low red blood cell count
• rash

These are not all of the possible side effects of UPTRAVI.

Call your doctor for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

How should I store UPTRAVI?
• Store UPTRAVI tablets at room temperature between 68°F and 77°F (20°C and 25°C).

Keep UPTRAVI and all medicines out of the reach of children.

General information about the safe and effective use of UPTRAVI
Medicines are sometimes prescribed for purposes other than those listed in a Patient Information leaflet.

Do not use UPTRAVI for a condition for which it was not prescribed. Do not give UPTRAVI to other people, even if they have the same symptoms that you have. It may harm them. You can ask your healthcare provider or pharmacist for information about UPTRAVI that is written for health professionals.

What are the ingredients in UPTRAVI?
Active ingredient: selexipag
Inactive ingredients: D-mannitol, corn starch, low substituted hydroxypropylcellulose, hydroxypropylcellulose, and magnesium stearate.
The tablets are film coated with a coating material containing hypromellose, propylene glycol, titanium dioxide, carnauba wax along with iron oxide red, iron oxide yellow, or iron oxide black.
